Simple & Easy Notification Service API by Naver Cloud

# 1. 프로젝트 기술 스택

### ∰ 공통

상세	내용
GitLab	형상 관리
Jira	일정 및 이슈 관리
Mattermost	커뮤니케이션
Notion	일정 및 문서 관리
IntelliJ	IDE (2022.02)
Visual Studio Code	IDE

### FrontEnd

상세	버전
Node.js	18.17.0
NPM	9.6.7
React	5.0.1
Zustand	4.3.9
React-router-dom	6.14.2
TypeScript	5.1.6

### **BackEnd**

상세	버전
JDK (Zulu)	11.0.19
SpringBoot	2.7.13
Mqttv3	1.2.5
JWT	0.9.1
MySQL	8.0.26
Ubuntu	20.04.6 LTS
Nginx	1.18.0
Docker	24.0.5
Docker-compose	2.20.2
Jenkins	2.401.3

### **✓** IoT

상세	버전
Arduino	Arduino IDE 2.1.1
Raspberry Pi	rasbian os 32bit
paho.mqtt	1.6.1
QT Framework	5.15.2
Flask	1.1.2

# 2. Frontend

### 패키지 설치 및 실행

npm install npm start

# 빌드 및 배포

Dockerfile을 통해 진행

### 3. Backend

# 빌드 및 배포

Dockerfile을 통해 진행

### 4. AWS EC2

#### Docker

```
sudo apt update
sudo apt upgrade
sudo apt install docker-ce
```

#### **Jenkins**

• Docker에 Jenkins 설치 및 구동

```
docker run -d -p 5000:5000 -v /var/jenkins:/var/jenkins_home
-v /var/run/docker.sock:/var/run/docker.sock --name jenkins-container jenkins/jenkins:lts
```

### 5. Jenkins

### GitLab PlugIn 설치 및 연동

### 자동 빌드 및 배포 설정

#### Jenkins Backend execute shell

```
chmod +x backend
cd backend
chmod +x ./gradlew
./gradlew clean build
docker-compose up -d --build
```

#### Jenkins Frontend execute shell

```
chmod +x frontend
cd frontend
docker-compose up -d --build
```

#### **Jenkins Pipeline script**

```
pipeline {
   agent any
    stages {
       stage ('Git clone') {
           steps {
               script {
                   git branch: 'develop', credentialsId: 'ysang10', url: 'https://lab.ssafy.com/s09-webmobile3-sub2/S09P12A101'
           }
        stage ('Backend build') {
           steps {
              script {
sh '''
                   chmod +x backend
                  cd backend
                  chmod +x ./gradlew
                   ./gradlew clean build
                   docker-compose up -d --build
           }
        stage ('Frontend build') {
           steps {
               script {
```

```
chmod +x frontend
                                                        cd frontend
                                                        docker-compose up -d --build
                         }
          }
post {
            success {
                    script {

                                         mattermostSend (color: 'danger',
                                         message: "\c 4m: $\{env.JOB\_NAME\} \ \# \{env.BUILD\_NUMBER\} \ by $\{Author\_ID\}(\c 4mes)\n(\c 4mes)\n(\c 4mes)\n(\c 4message) \ has been also been als
         }
```

### 6. Docker

#### **Frontend**

#### **Dockerfile**

```
# node verion : 18.16.1
FROM node:18.16.1-alpine as builder
# 작업 위치 지정
WORKDIR /app
# 환경 변수 지정
# 개발 환경에서는 development, 운영(배포) 환경에서는 production
ENV NODE_ENV development
ENV PATH /app/node_modules/.bin:$PATH
# 현재 파일을 복사
COPY . .
# package.json에 명시된 의존성 설치
RUN npm install --force
# 빌드 시작
RUN npm run build
# nginx
FROM nginx:latest
RUN mkdir /app
WORKDIR /app
# 기존 환경 설정 제거
RUN rm /etc/nginx/conf.d/default.conf
# 디렉토리의 conf 파일을 복사
COPY ./nginx.conf /etc/nginx/conf.d
# builder로 부터 /app/build를 복사해옵니다.
COPY --from=builder /app/build /app/build
# 3000번 포트를 노출한다고 써놨지만, 이는 명시하기 위한 것으로 반드시 docker run의 옵션으로 포트 매핑을 해야함.
EXPOSE 3000
CMD ["nginx", "-g", "daemon off;"]
```

#### nginx.conf

```
server {
   listen 3000;
   location / {
```

```
root /app/build;
index index.html;
try_files $uri $uri/ /index.html;
}
```

#### docker-compose.yml

```
version: "3"
# 정의할 서비스들의 목록
services:
        # 서비스 이름 지정
